

DRI-FLO™

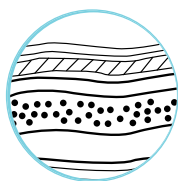

Air-permeable underpad protection designed to maintain the benefits of microclimate management therapies.

DRI-FLO™ UNDERPADS

Tri-dimensional matting creates air-permeable durability

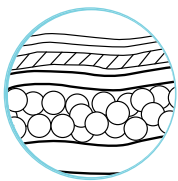

Dri-Flo™ Underpads are constructed using a three-layer bonding process that integrates the top, core and backsheet of the underpad. This process produces a highly absorbent, breathable underpad that allows patients to receive the full benefits of underlying KCI microclimate management therapies.

Dry

First Void

Second Void

Features	Benefits
Soft, permeable top layer	<ul style="list-style-type: none">• Allows fluid to pass to the core of the underpad• Keeps moisture away from the patient's skin
Tri-dimensional matting	<ul style="list-style-type: none">• Provides tensile strength and durability
Super absorbent polymers	<ul style="list-style-type: none">• Draws fluid away from patient's skin and encapsulates it within the core• Absorbs secondary voids reducing associated odors
Breathable back sheet	<ul style="list-style-type: none">• Allows underlying microclimate therapies to function properly• Helps keep patient's skin cool, dry and comfortable

Compared to other incontinence underpads, Dri-Flos™:

- Provide the maximum amount of airflow, even when wet, keeping the patient's skin dry and comfortable.*
- Maintain a higher level of structural integrity due to a greater level of tensile strength. This may decrease the number of underpad changes required.*
